Fundamental Issues Critical to the Success of Nuclear Projects Stock Market Prediction and Efficiency Analysis using Recurrent Neural Network

The purpose of this project is to develop an information system that will be useful to municipal solid waste managers as they explore the implications of potential municipal solid waste management policy options in terms of their material use, energy use, waste minimization, and economic consequences over their life-cycles in the municipal solid waste stream. Policy changes (regarding, for instance, mandatory recycled content and standards) are being considered at national, state, and local levels. The public is also currently sensitized to problems with the municipal solid waste management system, and they are all too mindful of the egregious waste management problems associated with past management policies and practices. There also seems to be a specific popular social agenda that may not be founded in careful technical and economic analyses, but in social perception. Complicating matters is the fact that different "solutions" to

waste management problems do not seem to be easily reconciled with each other. An important reason for this seeming irreconcilability is that stakeholder groups often portray the effects of a particular plan in a carefully simplified, bounded, context-specific manner. Unfortunately, the waste management system is far too complex for such simplistic analyses. As such, proponents of any one policy rarely consider the complete set of effects or the tradeoffs implied by that policy change. To address these issues, this project, the first-year of a multi-year fundamental analysis of the solid waste management system, has produced a simulation which includes all major waste management technologies (landfilling, incineration, recycling, composting, and source reduction), the socioeconomics of the waste management system (the markets, the costs/benefits and their distributions), and the impacts of different policies and regulations. The analysis provides insights and answers regarding the complete effects of proposed solid waste management policy changes, as well as the tradeoffs when choosing among them in the case of a simplified case study. The project has produced a graphical display simulation model that should aid in understanding the policy options, evaluation of different strategies and communication of the results. Future plans include calibration of the model to an actual planning situation for a public waste management

entity. Actual data from a regional case study will be used to calibrate and validate the model. Inconsistencies and formulation needs will be identified and problems will be reconciled in order to accurately depict the policy making needs of a particular public waste management entity. Then the model will be made available more generally through the Department of Energy to examine prospective policy choices that must be made by municipal solid waste decision-makers in government and industry.

The objective of this project was to develop a new theoretical method called "contribution theory" that can be used to gain deeper understanding of radiation transport phenomena. The method had been propose during the 1970's as a promising technique for improving radiation shield designs, and was actually applied to several reactor shielding studies at that time. However the theoretical basis of the method was never firmly established, and numerical procedures were not developed for efficient use of the method. Hence one important component of this project is to perform a study of the basic theory of contributions to understand how to better apply the method, and to

develop calculational methods for using the theoretical tools effectively. Furthermore, the fundamental concepts of contribution theory can be applied in other areas besides shielding optimization, including Monte Carlo calculations and neutron spectrum analysis; therefore the project also examined possible extended uses of contribution theory. Finally, in order for the method to become a useful tool for radiation transport analysis, it is necessary to demonstrate that it can be used to analyze realistic configurations; therefore the project also has developed computer programs that can be applied to realistic systems.

Many current and future modeling applications at Sandia including ASC milestones will critically depend on the simultaneous solution of vastly different physical phenomena. Issues due to code coupling are often not addressed, understood, or even recognized. The objectives of the LDRD has been both in theory and in code development. We will show that we have provided a fundamental analysis of coupling, i.e., when strong coupling vs. a successive substitution strategy is needed. We have enabled the implementation of tighter coupling strategies through additions to the NOX and Sierra code suites to make coupling strategies available now. We have leveraged existing functionality to do this. Specifically, we have built into NOX the capability to handle fully coupled simulations from multiple codes, and we have also built into NOX the capability to handle Jacobi Free Newton Krylov simulations that link multiple applications. We show how this capability may be accessed from within the Sierra Framework as well as from outside of Sierra. The critical impact from this LDRD is that we have shown how and have delivered strategies for enabling strong Newton-based coupling while respecting the modularity of existing codes. This will facilitate the use of these codes in a coupled manner to solve multi-physic applications.

"Buying and selling of stock is an easy task and anyone can do it. But what to buy, when to buy, at what price to buy, how much capital to allocate and when to sell are the questions for which many investors don't have the answer. Though anyone can do buying and selling of shares without knowledge, that won't make money. Just like a prior knowledge and training is required to do any task efficiently, training is required to invest efficiently in stocks also. Sensex was at 100 points in 1979 and today at 30,000+, despite the 15% CAGR growth in the market many fail to earn here just because of lack of knowledge and understanding of the stock market. This book explains in an easy manner various investing principles. From this book, you can learn. · How to find the right industry to invest. · How to read the annual reports and financial statements. · How to get stock ideas. · How to do the valuation of stock price. · How to design a profit-maximizing and risk minimizing portfolio."

This book is a simple and concise text on the subject of security analysis and portfolio management. It is targeted towards those who do not have prior background in finance, and hence the text veers away from rather complicated formulations and discussions. The course 'Security Analysis and Portfolio Management' is usually taught as an elective for students specialising in financial management, and the authors have an experience of teaching this course for more than two decades. The book contains real empirical evidence and examples in terms of returns, risk and price multiples from the Indian equity markets (over the past two decades) that are a result of the analysis undertaken by the authors themselves. This empirical evidence and analysis help the reader in understanding basic concepts through real data of the Indian stock market. To drive home concepts, each chapter has many illustrations and case-lets citing real-life examples and sections called 'points to ponder' to encourage independent thinking and critical examination. For practice, each chapter has many numericals, questions, and assignments

The spectral analysis of waveforms, whether these waves are acoustic or electrical in nature, has evolved into an important aspect of quite a wide variety of scientific endeavors. Utilized primarily be the Navy in the Study of underwater sound, frequency analysis also finds utility in research on

mechanical vibrations, speech, music, et cetera. Real-time capability is necessary for many of these applications. That is, the transformation must be completed within the time interval over which its sampled data is acquired so that spectral plots may be generated on a continuing basis. The basis for a computer-aided frequency analysis scheme is known as a Discrete Fourier Transform, or DFT. The inherent flexibility of a general purpose computer lends itself quite well to the implementation of a high speed adaptation of the DFT, called a Fast fourier Transform or FFT. (Author).

Individual Participant Data Meta-Analysis: A Handbook for Healthcare Research provides a comprehensive introduction to the fundamental principles and methods that healthcare researchers need when considering, conducting or using individual participant data (IPD) meta-analysis projects. Written and edited by researchers with substantial experience in the field, the book details key concepts and practical guidance for each stage of an IPD meta-analysis project, alongside illustrated examples and summary learning points. Split into five parts, the book chapters take the reader through the journey from initiating and planning IPD projects to obtaining, checking, and meta-analysing IPD, and appraising and reporting findings. The book initially focuses on the synthesis of IPD from randomised trials to evaluate treatment effects, including the evaluation of participant-level effect modifiers (treatment-covariate interactions). Detailed extension is then made to specialist topics such as diagnostic test accuracy, prognostic factors, risk prediction models, and advanced statistical topics such as multivariate and network meta-analysis, power calculations, and missing data. Intended for a broad audience, the book will enable the reader to: Understand the advantages of the IPD approach and decide when it is needed over a conventional systematic review Recognise the scope, resources and challenges of IPD meta-analysis projects Appreciate the importance of a multi-disciplinary project team and close collaboration with the original study investigators Understand how to obtain, check, manage and harmonise IPD from multiple studies Examine risk of bias (quality) of IPD and minimise potential biases throughout the project Understand fundamental statistical methods for IPD meta-analysis, including two-stage and one-stage approaches (and their differences), and statistical software to implement them Clearly report and disseminate IPD meta-analyses to inform policy, practice and future research Critically appraise existing IPD meta-analysis projects Address specialist topics such as effect modification, multiple correlated outcomes, multiple treatment comparisons, non-linear relationships, test accuracy at multiple thresholds, multiple imputation, and developing and validating clinical prediction models Detailed examples and case studies are provided throughout. *Fundamental Remote Science Research Program. The 2015 Brookings Financial and Digital Inclusion Project (FDIP) Report and Scorecard evaluate access to and usage of affordable financial services across 21 geographically and economically diverse countries. The 2015 FDIP Report and Scorecard seek to answer a set of fundamental questions about today's global financial inclusion efforts, including: 1) Do country commitments make a difference in progress toward financial inclusion?; 2) To what extent do mobile and other digital technologies advance financial inclusion?; and 3) What legal, policy, and regulatory approaches promote financial inclusion? John D. Villasenor, Darrell M. West, and Robin J. Lewis analyzed the financial inclusion landscape in Afghanistan, Bangladesh, Brazil, Chile, Colombia, Ethiopia, India, Indonesia, Kenya, Malawi, Mexico, Nigeria, Pakistan, Peru, the Philippines, Rwanda, South Africa, Tanzania, Turkey, Uganda, and Zambia. Countries received scores and rankings based on 33 indicators spanning four dimensions: country commitment, mobile capacity, regulatory environment, and adoption of traditional and digital financial services. The authors' analysis provides several takeaways with respect to expanding financial inclusion across diverse cultural, economic, and political contexts: · Country commitment is fundamental. · Movement toward digital financial services will accelerate financial inclusion. · Geography generally matters less than policy, legal, and regulatory changes, although some regional trends in terms of financial services provision are evident. · Central banks, ministries of finance, ministries of communications, banks, nonbank financial providers, and mobile network operators play major roles in achieving

greater financial inclusion. · Full financial inclusion cannot be achieved without addressing the financial inclusion gender gap. This year's Report and Scorecard are the first of a series of publications intended to provide policymakers, the private sector, nongovernmental organizations, and the general public with information that can help improve financial inclusion in these countries and around the world.
