Corrosion Lloyd's Register

The Lloyd's Register Technical Association (LRTA) was established in 1920 with the primary objective of sharing technical expertise and knowledge within Lloyd's Register. Publications have consistently been released on a yearly basis, with a brief interruption between 1938 and 1946. These publications serve as a key reference point for best practices and were initially reserved for internal use to maximise LR's competitive advantage. Today, the LRTA takes a fresh approach, focusing on collaboration by combining professional expertise from across LRF & Group to ensure a frequent output of fresh perspectives and relevant content. The LRTA has evolved into a Group-wide initiative that identifies, captures, and shares knowledge spanning various business streams and functions. To support this modern approach, the LRTA has adopted a new structure featuring representatives and senior governance across the business streams and the LR Foundation. The Lloyd's Register Technical Association Papers should be seen as historical documents representing earlier viewpoints and are not reflective of current thinking and perspectives by the current LR Technical Association.

 The rate of growth of stainless steel has outpaced that of other metals and alloys, and by 2010 may surpass aluminum as the second most widely used metal after carbon steel. The 2007 world production of stainless steel was approximately 30,000,000 tons and has nearly doubled in the last ten years. This growth is occurring at the same time that the production of stainless steel continues to become more consolidated. One result of this is a more widespread need to understand stainless steel with fewer resources to provide that information. The concurrent technical evolution in stainless steel and increasing volatility of raw material prices has made it more important for the engineers and designers who use stainless steel to make sound technical judgments about which stainless steels to use and how to use them.

Regarded as a "must have" design aid for engineers, designers, fabricators and other specifiers of structural steel, the Design Capacity Tables for Structural Steel (DCT) provides information for the design and detailing of structural steel members and connections. Data is presented in the limit states format of AS 4100. Volume 1 of the DCT contains information on the readily available range of "open" structural steel sections (WB,WC, UB, UC, PFC, TFC, TFB, EA & UA). Also included are BHP Grade 300PLUSTM, the new "Lean Beams", and incorporation of Amendments 1 and 2 to AS 4100. Significant enhancements have been made to the second edition, including improved table layout and easy to read design curves. Data in the DCT includes: dimensions and section properties; design section capacities; values for fire design; and design capacities for members subject to bending, shear, bearing, axial compression, axial tension and combined actions. Also included are design capacities for bolts, welds and floor plates; elastic buckling loads; detailing parameters; section properties for gantry girders and rails; and useful tables for angles subjects to flexural loadings about their rectangular axes (restrained and unrestrained) and angles in trusses. Volume 2 of the DCT (DCTv2ed2) provides up-to-date information on the full range of Australian manufactured hollow sections complying with AS 1163. Additionally, the 1998 version of AS 4100 included some significant changes to the hollow section design provisions. These changes have also been incorporated in DCTv2ed2. Other features of DCTv2ed2 include tables associated with section properties, surface areas, telescoping sections, maximum design loads for simply supported beams with full lateral restraint, design section moment (including torsion) and web capacities, design moment capacities for members without full lateral restraint and design member capacities in axial compression/tension. The text includes data used to generate the tables, information relevant to common applications, useful examples and noting of clauses/equations in AS 4100 which are specific to hollow sections.

This open access book offers a timely guide to challenges and current practices to permanently plug and abandon hydrocarbon

wells. With a focus on offshore North Sea, it analyzes the process of plug and abandonment of hydrocarbon wells through the establishment of permanent well barriers. It provides the reader with extensive knowledge on the type of barriers, their functioning and verification. It then discusses plug and abandonment methodologies, analyzing different types of permanent plugging materials. Last, it describes some tests for verifying the integrity and functionality of installed permanent barriers. The book offers a comprehensive reference guide to well plugging and abandonment (P&A) and well integrity testing. The book also presents new technologies that have been proposed to be used in plugging and abandoning of wells, which might be game-changing technologies, but they are still in laboratory or testing level. Given its scope, it addresses students and researchers in both academia and industry. It also provides information for engineers who work in petroleum industry and should be familiarized with P&A of hydrocarbon wells to reduce the time of P&A by considering it during well planning and construction.

The first book in a two-volume revision of the 1987 Metals Handbook, 9th edition, addresses the needs of the global technical community for current information. Chapters on fundamentals cover the theory of aqueous and gaseous corrosion from thermodynamic and kinetic perspectives, while chapters on forms of corrosion tell how to recognize different types and the forces that influence them. Testing and evaluation methods are addressed as are methods of protection and topics related to redesigning for corrosion control and prevention. A section on tools for the corrosionist provides conventions and definitions, information sources and databases, and information on analytical instruments. Casing design has followed an evolutionary trend and most improvements have been made due to the advancement of technology. Contributions to the technology in casing design have come from fundamental research and field tests, which have made casing safe and economical. This book gathers together much available information in the subject area and shows how it may be used in deciding the best procedure for casing design i.e. optimizing casing design for deriving maximum profit from a particular well. The problems and their solutions, which are provided in each chapter, and the computer program (3.5 in. disk) are intended to serve two purposes:- firstly, as illustrations for students and practicing engineers to understand the subject matter, and secondly, to enable them to optimize casing design for a wide range of wells to be drilled in the future.
