 This compilation probably looks like one of the craziest things a human being could spend his or her time on. Yet nobody would wonder at someone taking a short walk every day - after twenty five years that person would have covered a surprisingly long distance. This is exactly the story behind this list, which appeared first as a few pages within the directory StarGuides (or whatever

name it had at that time) and as a distinct sister publication since 1990. The idea behind this dictionary is to offer astronomers and related space scientists practical assistance in decoding the numerous abbreviations, acronyms, contractions and symbols which they might encounter in all aspects of the vast range of their professional activities, including traveling. Perhaps it is a bit paradoxical, but if scientists quickly grasp the meaning of an acronym solely in their own specific discipline, they will probably encounter more difficulties when dealing with adjacent fields. It is for this purpose that this dictionary might be most often used. Scientists might also refer to this compilation in order to avoid identifying a project by an acronym which already has too many meanings or confused definitions.

A Report to the President and the Congress W. W. Norton & Company

The ability to use the scientific method is key to carrying out experiments, taking measurements, or performing technical tasks. In this book, readers in real-world situations are tasked

with following clues and using the scientific method to find out what happens during a flood. Informational text presents evidence and facts in the form of clues and side-bar details to help children develop critical thinking skills. A summary of the situation is included to show how each chapter contributes to the whole and for a solid understanding of the topic.

The riveting story of one of the greatest but least-known sagas in the history of exploration from David Roberts, the “dean of adventure writing.” By 1930, no place in the world was less well explored than Greenland. The native Inuit had occupied the relatively accessible west coast for centuries. The east coast, however, was another story. In August 1930, Henry George Watkins (nicknamed “Gino”), a twenty-three-year-old British explorer, led thirteen scientists and explorers on an ambitious expedition to the east coast of Greenland and into its vast and forbidding interior to set up a permanent meteorological base on the icecap, 8,200 feet above sea level. The Ice Cap Station was to be the anchor of a transpolar route of air travel from Europe to North America. The weather on the ice cap was appalling. Fierce storms. Temperatures plunging lower than -50° Fahrenheit in the winter. Watkins’s scheme called for rotating teams of two men each to monitor the station for two months at a time. No one had ever tried to winter over in that hostile landscape, let alone manage a weather station through twelve continuous months. Watkins was younger than anyone under his command. But he had several daring trips to the Arctic under his belt and no one doubted his judgement. The first crisis came in the fall when a snowstorm stranded a resupply mission halfway to the top for many weeks. When they arrived at the ice cap, there were not enough provisions and fuel for another two-man shift, so the station would have to be abandoned. Then team member August Courtauld made an astonishing offer. To enable the mission to go forward, he would monitor the station solo through the winter. When a team went up in March to relieve Courtauld, after weeks of brutal effort to make the 130-mile journey, they could find no trace of him or the station. By the end of March, Courtauld’s situation was desperate. He was buried under an immovable load of frozen snow and was disastrously short on supplies. On April 21, four months after Courtauld began his solitary vigil, Gino Watkins set out inland with two companions to find and rescue him. David Roberts, “veteran mountain climber and chronicler of adventures” (Washington Post), draws on firsthand accounts and archival materials to tell the story of this daring expedition and of the epic survival ordeal that ensued.

Guiding you to the best of everything in Vermont for over 30 years! Although Explorer’s Guide Vermont covers the entire Green Mountain State, the authors pride themselves on their detailed coverage of the state’s less-traveled areas, especially the Northeast Kingdom. You’ll also find in-depth descriptions of major Vermont destinations like Burlington, Brattleboro, Manchester, and Woodstock. They always highlight the most interesting and rewarding places to visit, whether on back roads or in bigger cities—artists’ studios, family farms, and historic sites among them. This guide provides great recommendations for every activity you’re looking for—mountain and road biking; hiking and swimming; skiing, snowshoeing, and snowboarding; horseback riding, fishing, and paddling—and many more, both on and off the beaten track.

Provides step-by-step instructions for performing experiments designed to answer such questions about the weather as what makes it rain, how do scientists measure air pressure, and how does temperature affect air movement.

In this book, students see the NextGen Science process at work in a real-world situation. Readers practice close reading as they look for clues that will lead to a deeper understanding of structures and engineering. The NextGen Science process pushes students to apply critical thinking as they learn new methods of exploration and build on concepts they may already know. Additional tools, including a glossary and index, help students learn new vocabulary and locate information.

The second edition of this concise, affordable textbook is ideal for curious undergraduate majors and non-majors taking a first course in meteorology. The first two chapters introduce readers to the main concepts and tools used to analyze weather patterns. Chapters 3-8 provide a foundational understanding of the fundamental processes taking place in the atmosphere, and in Chapters 9-12 these physical concepts are applied to specific weather phenomena. Weather concepts are then used in Chapters 13-15 to explain weather forecasting, air pollution, and the impact of climate change on weather. Key concepts are illustrated through a running case study of a single mid-latitude cyclone, providing students with an opportunity to progressively develop their understanding of weather phenomena with a familiar example approached from multiple perspectives. This edition includes expanded and updated coverage of precipitation types and formation, satellite and radar technology, tornadoes, and more. It also features thought-provoking end-of-chapter review questions, new visual analysis exercises, an expanded test bank and nearly 100 new figures.

In the tradition of *The Ice Master* and *Endurance*, here is the incredible story of the first truly modern explorer, whose death-defying adventures and uncommon modesty make this book itself an extraordinary discovery. Hubert Wilkins was the most successful explorer in history—no one saw with his own eyes more undiscovered land and sea. Largely self-taught, Wilkins became a celebrated newsreel cameraman in the early 1900s, as

well as a reporter, pilot, spy, war hero, scientist, and adventurer, capturing in his lens war and famine, cheating death repeatedly, meeting world leaders like Lenin and Stalin, and circling the globe on a zeppelin. Apprenticing with the greats of polar exploration, including Shackleton in the Antarctic, Wilkins recognized the importance of new technologies such as the airplane and submarine. He helped map the Canadian Arctic and plumbed the ocean depths from the icecap. A pioneer in the truest sense of the word, he became the first man to fly across the North Pole, which won him a knighthood; the first to fly to the Antarctic and discover land there by airplane; and the first to take a submarine

under the Arctic ice. Grasping the link between the poles and changing global weather, Wilkins was a visionary in weather forecasting and the study of global warming. A true hero of the earth, he changed the way we look at our world.
