Janet Carr and Roberta Shepherd head up a new team of eminent authors for the second edition of this definitive text on neurological physiotherapy. In the first edition, the authors described a model of neurological rehabilitation for individuals with motor dysfunction based on scientific research in the areas of neuromuscular control, biomechanics, motor skill learning, and the link between cognition and action, together with developments in pathology and adaptation. The new edition continues to advance this model while identifying and incorporating the many advances that have occurred in the last decade in the understanding and treatment of adults with neurological conditions, whether caused by accident or disease. Among these advances is the knowledge that the brain retains a plastic potential to reorganize, even in old and/or lesioned brains, and that neural plasticity can be influenced by task-related mental and physical practice in

a stimulating environment. There is also an increasing body of knowledge related to the musculoskeletal system's adaptability and the need to prevent length and stiffness- related changes in muscle contractility, together with loss of aerobic fitness and endurance. There is an expanding body of clinical research that appears to support the model provided here. The training guidelines outlined in Neurological Rehabilitation are based on biomechanical constructs and motor relearning research, applied to enhance brain reorganization and muscle contractility, and encourage functional recovery of the patient. It connects science and clinical practice enabling students and practitioners to develop their knowledge and use new clinical methods based on modern scientific understanding. All chapters have been revised, some with the collaboration of five specialists who are engaged in high level scientific research and clinical practice Biomechanical models are presented to provide a framework for action-specific training and exercise to improve performance Clinical guidelines are science- and evidence-based Emphasis is on new approaches to the delivery of neurological rehabilitation that increase the time spent in mental and physical activity, and the intensity of practice and exercise Up-to-date referencing Elsevier Health Sciences

The profession of occupational therapy has a highly specialised language, but until now there have been no standard definitions of its key terms. Based on the work of the terminology project group of the European Network of Occupational Therapy in Higher Education (ENOTHE), this book selects and defines the core building blocks of occupational therapy theory. Consensus definitions of a wide range of terms are developed through an analysis of published definitions from around the world. Concepts with similar meanings are clustered into groups, and the clusters are then arranged into a conceptual map. The book provides an analysis of what each term means in common usage, how it is used in occupational therapy, and its implications for therapeutic practice. The conceptual framework that emerges represents an important contribution to the profession's understanding of the fundamental concepts of occupational therapy. The consensus definitions presented in this book will facilitate communication between professionals as well as with clients and others, and will be of interest to occupational therapy practitioners, students, educators and researchers.

This valuable clinical reference alerts practitioners to potentially serious indicators of pathology in their patients, such as cancer, tuberculosis (TB), or other conditions. With a fresh approach to the subject, it presents an hierarchy of red flags, an index of suspicion, discussion of red herrings, "3D thinking," and conditional probabilities intended to assist with clinical reasoning. It's an ideal, on-the-spot resource for anyone involved in the care of patients with musculoskeletal conditions. The book's small, portable size makes it ideal for reference in any practice setting. Presents information in an accessible, at-a-glance format. The unique red flag hierarchy assists with clinical reasoning. Index of Suspicion highlights the most likely conditions indicated by specific red flags. Discussion of 3D thinking encourages clinicians to look beyond immediate symptoms to find the underlying cause of a problem. Discussion of red herrings describes how to approach indicators that may mislead a diagnosis. Information on the concept of conditional probabilities helps practitioners make informed clinical decisions.
