*The Complete Guide to Prehistoric Life*  
 Harper Collins

The ancient Chinese thought they were magical dragons. Scientists thought they could only float on water since they were so big. Boy, were they wrong! Even today, notions about dinosaurs are being revised as new discoveries are made. This lively book offers fascinating insight into how certain theories were formulated, and then how those theories were proved or disproved.

Build the T. Rex Scribner Book Company  
 This elegantly illustrated volume is a journey through more than two centuries of remarkable discovery. Books on dinosaurs are usually arranged by classification or epoch, but this unique work tells the story chronologically, in order of the key finds that shaped our understanding and brought these creatures to life for the public. From the fragmentary remains of giant extinct animals found in the early 1800s to the dinosaur wars in the American West to the amazing near-complete skeletons found around the world today, Darren Naish tells how these discoveries have led not only to the recognition of new species and whole new groups, but also to new theories of evolutionary history. Along the way, we encounter dinosaurs both familiar and obscure-including Tyrannosaurus rex, the

giant sauropods, and most recently, the feathered dinosaurs of China. As he describes these significant finds, Naish explains in clear, accessible language, how our ideas about dinosaur appearance, biology, and behavior have developed and changed over time, and what the state of knowledge is today. - Discusses each major dinosaur group - Illuminates the human side of fossil discoveries by describing explorers, scientists, and artists - Beautifully designed pages feature extensive captions, engaging text, and sidebars throughout on select topics of interest - Almost 200 illustrations include historical and contemporary photographs, art works, drawings, and maps

And most intriguingly, what ancient catastrophe - deeply rooted more than 70 million years in the past - prevented them from hatching?"--BOOK JACKET.

**Walking with Dinosaurs Annual 2001** DK Publishing (Dorling Kindersley)

This book covers the research processes that contributed to the BBC TV series *Walking with Dinosaurs*. How was the information obtained, what suppositions have been made and how did this translate to the programme? Creatures featured include ceratopsians, iguanodontids and ankylosaurs.

**Assembling the Dinosaur** Pan Macmillan

People of all ages are fascinated by dinosaurs. And they have a lot of questions about them too: When and where did dinosaurs live? Are they mentioned in the Bible? What does the fossil evidence tell us about dinosaurs? There are some people who say dinosaurs lived millions of years ago, long before humans. But if the Bible is correct when it talks about God's creation of the world and universe, then dinosaurs and people both lived on the earth at the same time. *Dinosaurs and the Bible* explores the historical, scriptural, and fossil evidence about dinosaurs, and shares what we can know after many years of thoughtful, careful research.

**Locked in Time** Pan Macmillan

Dinosaurs are fascinating creatures and their popularity seems never ending, fuelled by films such as *Jurassic Park* and documentaries such as *Walking with Dinosaurs*. Yet dinosaurs (or more

precisely non-avian dinosaurs) last trod the Earth 65 million years ago. All we know of them today are their fossilised bones, the tracks and traces that they left behind and, in very rare instances, some of the soft tissues or even traces of their chemistry. In many respects dinosaurs present us with one of the ultimate forensic challenges: they comprise the fragmentary remains of creatures that died many tens of millions of years ago, rather than just recently, or a few tens of years ago, which is the problem usually faced by forensic pathologists. How much do we really know about them, and to what extent can their remains inform us about ancient worlds, and indeed about the history of our planet? In this Very Short Introduction David Norman discusses how dinosaurs were first discovered and interpreted, and how our understanding of them has changed over the past 200 years. He looks at some of the amazing discoveries that have enabled us to gain new and unexpected insights into dinosaurs as animals with natural histories and behaviours, and considers some of the biggest questions in dinosaur biology, such as the implications of them having warm blood. Norman also shows how research upon dinosaurs has been enriched, particularly in recent decades, by technological break-throughs, which complement the informed speculation and luck which have played a part in many of the major discoveries. ABOUT THE SERIES: The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area. These pocket-sized books are the perfect way to get ahead in a new subject quickly. Our expert authors combine facts, analysis, perspective, new ideas, and enthusiasm to make interesting and challenging topics highly readable.

**Walking with Dinosaurs** National Geographic Books

Giant sauropod dinosaur skeletons from Patagonia; dinosaurs with feathers from China; a tiny dinosaur tail in Burmese amber complete down to every detail of its filament-like feathers, skin, bones and mummified muscles. Dinosaurs continue to regularly cause a media sensation. Remarkable new fossil finds are the lifeblood of modern palaeobiology, but it is the advances in technologies and methods that have allowed the revolution in the scope and confidence of the field. Over the past twenty years, the study of dinosaurs has become a true scientific discipline. New technologies have revealed secrets locked in the prehistoric bones in ways that nobody predicted we can now work out the colour of dinosaurs, their bite

forces, top speeds and even how they cared for their young. The *Dinosaurs Rediscovered* gathers together all the latest palaeontological evidence and takes us behind the scenes on expeditions and in museum laboratories, tracing the transformation of dinosaur study from its roots in antiquated natural history to a highly technical, computational and indisputably scientific field today. Michael J. Benton explores what we know of the world of the dinosaurs, how dinosaur remains are found and excavated, and how palaeontologists read the details of the lives of dinosaurs from fossils their colours, their growth, feeding and locomotion, how they grew from egg to adult, how they sensed the world, and even whether we will ever be able to bring them back to life. Dinosaurs are still very much a part of our world.

The Times Science Book of the Year. A Sunday Times Bestseller. 66 million years ago the dinosaurs were wiped from the face of the earth. Today, Dr. Steve Brusatte, one of the leading scientists of a new generation of dinosaur hunters, armed with cutting edge technology, is piecing together the complete story of how the dinosaurs ruled the earth for 150 million years. The world of the dinosaurs has fascinated on book and screen for decades - from early science fiction classics like *The Lost World*, to *Godzilla* terrorizing the streets of Tokyo, and the monsters of *Jurassic Park*. But what if we got it wrong? In *The Rise and Fall of the Dinosaurs*, top dinosaur expert Brusatte, tells the real story of how dinosaurs rose to dominate the planet. Using the fossil clues that have been gathered using state of the art technology, Brusatte follows these magnificent creatures from their beginnings in the Early Triassic period, through the Jurassic period to their final days in the Cretaceous and the legacy that they left behind. Along the way, Brusatte introduces us to modern day dinosaur hunters and gives an insight into what it's like to be a paleontologist. *The Rise and Fall of the Dinosaurs* is full of thrilling accounts of some of his personal discoveries, including primitive human-sized tyrannosaurs, monstrous carnivores even larger than *T. rex*, and feathered raptor dinosaurs preserved in lava from China. At a time when *Homo sapiens* has existed for less than 200,000 years and we are already talking about planetary extinction, *The Rise and Fall of the Dinosaurs* is a timely reminder of what humans can learn from the magnificent creatures who ruled the earth before us.

Pterosaurs, the first vertebrates to evolve powered flight, are undergoing a long-running scientific renaissance that has seen sustained, and even elevated interest, from several generations of palaeontologists. These incredible reptiles are known from every continent, flew the Mesozoic skies for at least 160 million years, diversified into more than a dozen major clades and well over 100 species, and included the largest flying animals of all time. This volume brings together leading pterosaur researchers from around the globe to discuss new and cutting-edge research into various aspects of pterosaur palaeobiology and presents diverse papers to deliver new insights on flying reptile palaeoecology, flight, ontogeny, skeletal and soft-tissue anatomy, temporal and spatial distribution and evolution, as well

as revisions of their taxonomy and interrelationships.

*Boy, Were We Wrong About Dinosaurs!*

Houghton Mifflin Harcourt

The Evidence goes beyond the fascinating material in *Walking with Dinosaurs*, the best-selling book that accompanied the phenomenally successful TV series. The Evidence covers the methods of the research processes that formed the backbone of the series. How was the information obtained, what suppositions have been made, and how did this translate to the programs? Around 250 million years ago dinosaurs first began to walk the earth, dominating the planet until their extinction 65 million years ago. In this incredible Mesozoic period lasting 170 million years, these creatures were the dominant animals on land. *Walking with Dinosaurs-The Evidence* explores the archeologists' and scientists' discoveries and shows how they piece together the lives of these fascinating creatures. Comprehensively illustrated, the book explains how the bones of dinosaurs and the ground in which they're found in can lead to conclusions about feeding habits, movement, mating, habitat, and the climate of the time.
